**Adiabatic expansion of saturated vapors and fog formation.** N. A. KOTOVSKII AND V. V. UDovenko. *J. Gen. Chem. (U. S. S. R.)* 1, 1253-8 (1931); cf. *C. A.* 26, 3078. The validity of the rule  $C_v'/\gamma = 10 > 0$ , for sp. heats of satd. vapors, where  $C_v'$  is sp. heat and  $\gamma$  no. of atoms in the mol, was established in a general way by allowing a satd. vapor to expand adiabatically from a bulb. The appearance of a fog is an indication of a neg  $C_v'$ , but when fog does not appear, the reverse is true. Fog formation was aided by ultra violet rays. Fog was observed in the following compds. in which  $\gamma = 10$ : CS, CHCl, CCl<sub>4</sub>, MeOH, MeCHO, nitromethane and EtOH. There was no fog formation in the following compds. in which  $\gamma > 10$ : MeCO, EtCOCl, CHOOEt, proH, C<sub>6</sub>H<sub>6</sub>, MeCOEt, AgOEt, BaO, Et<sub>2</sub>CO, CuH and PrO. S. L. MABOREK

PROCESSES AND PROPERTIES INDEX

3RD AND 4TH GRADES

A 1

Surface tension of systems ketones-organic acids. V. V. UDOVANCO, E. V. SITSCHEKOVA, and A. P. TOSOROV (J. Gen. Chem. Russ., 1939, 9, 2048-2054).—The surface tension-composition curves of the systems  $\text{COMe}_2$ , or  $\text{COMePr}-\text{R}-\text{COH}$  ( $\text{R} = \text{H, Me, Pr}$ ) and  $\text{COMe}_2-\text{AcOH}$ , at 20°, 35°, and 45°, deviate positively or negatively from the additive rule; these deviations are ascribed to shrinkage or dilatation of the liquids after mixing, rather than to formation of compounds. R. T.

(A) Viscosity in the ternary systems: phenol-benzenes-aniline, -dimethylaniline, and -diethyl-aniline. V. V. Upovnko and A. P. Tsoarov.  
 (B) Cryoscopic study of the systems phenol-aniline, -dimethylaniline, and -diethylaniline. V. V. Upovnko and M. I. Usanovitch (J. Gen. Chem. Russ., 1940, 10, 11-16, 17-20).—(A) The  $\eta$ -composition curves suggest formation of  $\text{PhOH}-$   
 $\text{NH}_2\text{Ph}$ ,  $-\text{NPhMe}_2$ , and  $-\text{NPhEt}_2$  compounds; the max. become less well-defined as the  $[\text{C}_6\text{H}_5\text{OH}]$  rises.

(b) The apparent mol. wt. of  $\text{NH}_2\text{Ph}$  and  $\text{NPhMe}_2$ , in  $\text{C}_6\text{H}_6$  rises with increasing concn.; that of  $\text{NPhEt}_2$ , remains const. In  $\text{PhOH}$  the apparent mol. wt. falls with rising concn. The mean apparent mol. wt. of mixtures of  $\text{PhOH}$  and amines in  $\text{C}_6\text{H}_6$  is > would follow from the additive rule, to a degree increasing with their concn. R. T.

Determination of molecular weight as a method of physicochemical analysis. V. V. Lidenko, *J. Gen. Chem. (U. S. S. R.)*, 11, 278-84 (1941).—Cryometric detns. made with mixts. of 2 components  $A + B$ , lead to values of a "mol. wt." of the two-component solute, defined by and calcd. from  $M = g/(1000K - M\Delta T)/\Delta T$ , where  $\Delta T$  is the observed lowering of the f. p. of  $g$ , the wt. of the mixed solute ( $A + B$ );  $K$ ,  $M$ ,  $g$ , the cryometric const., mol. wt. and wt. of the solvent, resp. For several mol. ratios  $A:B$ , the so-detd.  $M$  is plotted against the total concn. of ( $A + B$ ) (in mol. per 1000 g. solvent) in the soln. Next, plots of  $M$  against the mol. ratio  $A:B$  are constructed, (isoconcn. lines). Measurements were made in benzene soln. for the mixed solutes: (1) Toluene-ethylbenzene:  $M$  is independent of the concn. of ( $A + B$ ), for the pure components as well as for the mixt.; there is only one single isoconcn. line, a straight line. (2) Methanol-ethanol: for all ratios  $A:B$ , the  $M$  increases with increasing concn. of ( $A + B$ ); the isoconcn. lines are nearly parallel straight lines. (3) Piperidine-phenyl isothiocyanate: all isoconcn. lines show a common sharp max. at  $A:B = 1$ , which indicates compd. formation (naphthylpiperidine-thiourea, isolated and identified). (4) Methylanthranil-phenyl isothiocyanate: same shape as foregoing, max. at  $A:B = 1$ . Systems 1 and 2 illustrate cases without chapt. interaction between  $A$  and  $B$ . Moreover, in system 1,  $A$  and  $B$  are free from assocn. In system 2, both  $A$  and  $B$  are partly assoc'd.; the behavior of the  $M$  curves indicates that either the degree of assocn. of  $A$  and of  $B$  must remain unchanged with changing concn. or that dissoci. of  $A$ , and of  $B$ , is compensated by an assocn.  $AB$ . Systems 3 and 4 are examples of components with chapt. interaction. The compd.  $AB$  is assoc'd., the degree of assocn. rising with increasing concn.

Mol. wt. determinations as a means of physico-chemical analysis.  
V. V. Udoventko, *Acta Physicochim. U.R.S.S.*, 1942, 18, 336-347).—  
The variation of mol. wt. with composition is determined by the  
cryoscopic method and plotted in the case of MeOH-EtOH, and  
PhMe-PhEt mixtures in  $C_6H_6$ , to represent mixtures of similar  
mols. where there is no chemical interaction, and for piperidine-  
PhNCS and NHMePh-PhNCS mixtures, where there is interaction.  
The mol. wt.-composition curve is a straight line where there is  
no interaction, but the curve shows a max. coinciding with the com-  
position of the compound where there is interaction. A. J. M.

Investigation of systems with formic acid. II. V. V. Udrovskaya and N. P. Alpatov. *J. Gen. Chem. (U.S.S.R.)* 17, 608-8 (1947) (in Russian); cf. *C.A.* 43, 2502d. Viscosity, elec. cond., and d. were studied in binary systems for formic acid (I) with  $\text{H}_2\text{B}$  formate (II) and with  $\text{H}_2\text{B}$  ether (III). No compounds are formed in either system, but there is a weak interaction between I and II. In the I-II system the viscosity decreases smoothly from I to II, the curve being concave towards the concn. axis. Values of the viscosity at 0, 25, and 50° for I are 2.2310, 1.5372, and 0.9767; and for II, 0.6236, 0.2072, and 0.3060 centipoise. The cond.-concn. curves are similar, except that there are breaks in the curves at about 24 mol-% II. Values of the cond. are: I, 0.74, 1.24, 1.76; and II, 0.003, 0.003, and  $0.003 \times 10^{-4} \text{ ohm}^{-1} \text{ cm.}^{-1}$ . Values of the d. are: I

1.2375, 1.3068, 1.1846; and II 0.9474, 0.9166, 0.8818 g./cc. No breaks or max. were observed in the curves of d., viscosity, or cond. of I-III series. The viscosity-concn. curve was similar to the I-II system. At 0 and 25°, III has values of: viscosity 0.2668 and 0.2401 centipoises; cond. less than  $10^{-1}$  ohm $^{-1}$  cm. $^{-1}$  at both temps.; d. 0.7223 and 0.7048 g./cc.

UDOVENKO, V. V.

Determination of the molecular weight as a method of physicochemical analysis. II. V. V. Udoenko and S. V. Bubak. *J. Gen. Chem. (U.S.S.R.)* 17, 655-64 (1947) (in Russian); cf. *C.A.* 35, 61754.—The apparent mol. wt.  $M$  of a few binary systems of noninteracting components one of which is subject to assocn. was detd. by cryoscopy in  $C_6H_6$  soln. and was plotted against the compn. for the total molalities  $m = 0$  (infinite diln.), 0.5, 1.0, and 1.5 moles/1000 g.  $C_6H_6$ . In the system PhMe-MeOH, the  $m = 0$  isoconcentrate is a straight line; the  $m = 0.5$  curve is convex to the axis of compn., the  $m = 1.0$  and 1.5 curves pass through a min. shifting to the PhMe side with rising  $m$ . In PhMe-EtOH,  $m = 0$  is linear, the  $m = 0.5$ , 1.0, and 1.5 curves pass through a min. increasingly shifted to PhMe with rising  $m$ . In the PhMe- $PbNO_3$ , the  $m = 0$  isoconcentrate is again rectilinear, the other curves convex to the axis of compn., merging with the  $m = 0$  line at 72 mol. % PhMe. The system PhMe- $PbNH_3$  shows the same behavior; extrapolation to  $m = 0$  gives for  $PbNH_3$  a value of  $M$  somewhat higher than the theoretical; this was reproduced in repeated detns. irrespective of addnl. purification. The linearity of  $M$  at infinite diln. indicates absence of assocn. The min., and its shift, is the result, on the one hand, of the decrease of  $M$  due to decreasing assocn. of the alc. with its increasing diln. by PhMe, and, on the other hand, to the increase of  $M$  with increasing PhMe content. The absence of a min. in the case of  $PbNO_3$  and of  $PbNH_3$  means not only lower assocn. but mainly a lesser tendency to dissoe. on diln. with PhMe.

UDOVENKO, V. V.

V. V. Udoenko and Tz. B. Fried, The heats of evaporation of binary mixtures. I. P. 1136.

An equation has been derived for the heat of evaporation of binary liquid mixtures. For the calculation of this value, one has to know the heats of evaporation and the vapor pressures of the pure components and also their activity coefficients in the mixtures. The vapor pressure of three ideal systems have been studied at 50°, 60°, 70° and 80°: propyl alcohol - isobutyl alcohol, propyl alcohol - isoamyl alcohol and isobutyl alcohol - isoamyl alcohol.

Complex compounds of anabasine with cobalt salts.  
T. I. Sushkevich and V. V. Udoenko (Mid-Asian State

Univ. Tashkent). Doklady Akad. Nauk UzSSR. 3, 7, 1949, No. 3, 18-20 (in Russian).—Addn. of anabasine to aq.  $\text{CoCl}_4$ , with cooling, followed by addn. of HCl to dissolve the greenish ppt. of hydrated Co, gave blue  $\text{CoCl}_4 \cdot \text{C}_8\text{H}_{11}\text{N}_2 \cdot 2\text{HCl}$ , m. 283°, when an excess of HCl was used, or the corresponding  $\text{CoCl}_4 \cdot \text{C}_8\text{H}_{11}\text{N}_2 \cdot \text{HCl}$ , m. 303°, with the correspondingly smaller amount of HCl. Both are sol. in  $\text{H}_2\text{O}$ , insol. in usual org. solvents, except for hot  $\text{HCO}_2\text{H}$ ; both are electrolytes in aq. soln., and the cond. indicates complete dissociation. In soln. of the di-HCl salt with 0 ions being formed; the mono-HCl salt is a weak electrolyte. Anabasine also forms complexes with  $\text{CuCl}_4$  and  $\text{MnCl}_4$ , which are not described.

O. M. Kosolapoff

LA

Determination of molecular weight as a method of physicochemical analysis. V. V. Ulyanov, (Central Asian State Univ., Tashkent, U.S.S.R.), Izvest. Sektora Fiz.-Khim. Anal., Inst. Obrabotki Naft. Khim., Akad. Nauk S.S.R., 17, 101-18 (1948).—The use of the method is illustrated on MeOH and EtOH in  $C_6H_6$ . On the abscissa is plotted the concn. of the alc. in  $C_6H_6$  expressed as mol. of alc. per 1000 g. of  $C_6H_6$  and on the ordinate the apparent mol. wt. A family of curves is obtained of which the lowest curve is that of MeOH and the upper one of EtOH at zero concns. in  $C_6H_6$ . Between these two are the curves of alc. mixts. taken in various proportions but of the same total concn. in  $C_6H_6$ . Extrapolation to the ordinate, i.e. at zero concn., gives the mol. wt. of infinitely dil. solns. On the basis of this diagram is plotted a diagram of compn.-mol. wt. on which MeOH-EtOH compn. is the abscissa and the mol. wt. the ordinate. The family of curves (straight lines) thus obtained are isoconcentrations in which the lowest (at zero concn.) and the others at increasingly higher concns. by this method were obtained compn.-mol. wt. curves for a no. of systems. In the system toluene-ethylbenzene, the components do not react with each other and the mol. wt. of the pure components as well as of their mixt. does not change with their concn. in  $C_6H_6$ . Therefore, all the isoconcentrations coincide and on the diagram appears one straight line. In the system toluene-MeOH, the latter is an associ. compd. and its degree of association, depends on its concn. in  $C_6H_6$  or in its mixt. with toluene. Thus, at zero concn. of MeOH, the isoconcentration is a straight line and as its quantity increases the curves bend toward the abscissa. Similarly are discussed the diagrams of toluene-aniline, nitrobenzene-EtOH, acetone-EtOH, phenol-pyridine, formic acid-Et<sub>2</sub>O, methylaniline-phenylisothiocyanate, and chloral-EtOH.

Systems with formic acid. V. V. Uderman and B. P. Akrapetova. Zhur. Otschtech. Khim. 19, 187-94; J. Gen. Chem. U.S.S.R. 19, 142-5 (1949) (English translation); cf. C.A. 42, 3000a. Mol. wt. were determined for various mixts. of  $\text{HCOOH}$  (I) with  $\text{PhNO}_2$  (II),  $\text{AcOH}$  (III),  $\text{EtOOCH}$  (IV), and  $\text{Et}_2\text{O}$  (V). The solvent used in the mol. wt. determinations was  $\text{C}_2\text{H}_5\text{OH}$ . Graphs are given showing concns. of dissolved substances, viz., 0.0, 0.5, 1.0, and 1.5 moles per 1000 g. of  $\text{C}_2\text{H}_5\text{OH}$ . The values graphed were extrapolated or interpolated from the exptl. results. In all cases the curves are displaced towards higher mol. wt. by increasing the total concn. In the system I-II, the mol. wt.-concen. curve for the 0.5 molal case is linear, extending from (approx.) 90 for I to 320 for II. In the other three cases the curves are linear in the range 0-80 mole % I. From 80 to 100 mole % I, the 0.0 molal curve is concave, and the 1.0 and 1.5 molal curves are convex, toward the concen. axis, giving values for the mol. wt. of I of, resp.: 94, 95, and 115. In the system I-III, all the mol. wt.-concen. curves are linear, the 0.5 molal curve, e.g., extending from a mol. wt. of about 97 for I to about 128 for III. With increasing total concn. the slopes of the lines decrease. In the systems I-IV and I-V the curves all rises from a mol. wt. of 98 for I to a max. of 100 at 80 mole % I, and then drops to 78 for IV. The sharpness of the max. increases with increasing total concn. In the I-V case, the 0.5 molal curve rises from a mol. wt. of 98 for I to a max. of 106 at 80 mole % I and then drops to 78.2 for V. The mol. wt. of pure V changes less with concn. than that of any other pure substance or soln. investigated, and there is no consistent trend, whereas the mol. wt. of all other substances increased with increasing total concn.

Systems with formic acid. IV. V. V. Ushatinskii and R. P. Alimpetova. *Zhur. Obrabotki Khim. IV, 632-6; J. Gen. Chem. U.S.S.R. 19, 885-9 (1949) (English translation); cf. preceding note.—Mol. wts. were determined for various mixts. of formic acid (I) with acetone (II), 2-pentanone (III), and 2-pentanone (IV). As in the previous article, curves are shown for mol. wt. vs. concn. for total concn. of dissolved substances equal to 0.0, 0.6, 1.0, and 1.6 moles per 1000 g. benzene. In the system I-III, concn. and, whereas the 0.0 and 1.0 molal curves are concave towards the e.g., values of concn. of I (mole %) and mol. wt. are, resp.: 100, 107; 60, 108; 65, 102; 22, 98; 0.0, 66. In the system I-IV, the curves at all total concns. go through a max. at about 75 mole % I, the 1.0 molal curve going from a mol. wt. of 107 for I, through a max. of 110, then dropping to 74 for III. The system I-IV is similar, the 1.0 molal curve rising from a mol. wt. of 107 for I to a max. of 118 at 70 mole % I, and dropping to 98 for IV. The max. in these curves are attributed to chem. interaction among the components in the various systems. A. J. M.*

Viscosity and density of binary systems with nicotine. <sup>8</sup>  
III. S. P. Babak and V. V. Ulovenko (Samarkand Med. Inst.), Zhur. Obshchel Khim. (J. Gen. Chem.) 20, 1508-71 (1950); cf. C.A. 44, 6230. The nicotine-*o*-nitrophenol system shows a compn. max.  $-2C_6H_5(OH)NO_2$ . Viscosity of the system shows a max. at the above compn.; the highest max. is at 35° 8.0113 centipoises, lower max. at 60° 4.3888, and at 75° 2.0000. Density-compn. curves are smooth curves of linear type going from 0.9090 at 35° and 100 mol. % nicotine to 1.2615 at 15.03 mol. % nicotine, <sup>8</sup> at 60° from 0.9090 to 1.2851 at 0.0% nicotine, and at 75° from 0.9070 to 1.2571 at 0.0% nicotine. The nicotine-*PhNO<sub>2</sub>* system shows a linear viscosity relation: at 25° ranging from 1.7687 (0.0% nicotine) to 3.8042, at 50° from 1.1925 to 2.0376, at 75° from 0.8490 to 1.2620; values of d. similarly range from 1.2003 to 1.0068, from 1.1718 to 0.9806, and from 1.1480 to 0.9070, resp. The system with *p*-*MeC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>* has linear viscosity relations: at 25° from 2.0897 (0% nicotine) to 3.8042 (100%), at 50° from 1.3477 to 2.0376, at 75° from 0.9730 to 1.2620; d. varies similarly: from 1.1578 to 1.0098, from 1.1313 to 0.9806, from 1.1000 to 0.9670, resp. The system with *p*-*MeC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub>* has a linear viscosity relation: at 25° from 2.8922 (41.08 mol. % nicotine) to 3.8042 (100%), at 50° from 1.2008 (0%) to 2.0376 (100%), at 75° from 0.9881 (0%) to 1.2620 (100%); d. varies similarly: from 1.0793 to 1.0098, from 1.1223 to 0.9806, from 1.1013 to 0.9670, resp. Some compounds of pyridine with cupric chloride. V. V. Ulovenko<sup>1</sup> and E. M. Osipova<sup>2</sup> (Mid-Asian State Univ., Tashkent). *Zhur. Obshch. Khim.* 27, 2935-7 (1952).  
Equimol. amts. of anhyd. CuCl<sub>2</sub> and C<sub>6</sub>H<sub>5</sub>N, in abs. alc. or dry Me<sub>2</sub>CO form light-blue CuCl<sub>2</sub>·2C<sub>6</sub>H<sub>5</sub>N (I), which slowly (in a few hrs.) changes into gray CuCl<sub>2</sub>·C<sub>6</sub>H<sub>5</sub>N (II). With HCl, I forms 1·2HCl, yellow prisms, and dark brown crystals of 3CuCl<sub>2</sub>·2C<sub>6</sub>H<sub>5</sub>N·2H<sub>2</sub>O (III). This reaction can take place in moist HCl vapor, but not in dry HCl gas. II is not sol. in org. solvents; in H<sub>2</sub>O, it is decompd. into I and CuCl<sub>2</sub>. Heated above 200°, I loses C<sub>6</sub>H<sub>5</sub>N becoming anhyd. CuCl<sub>2</sub>. III is obtained from aq. solns. contg. strictly stoichiometric amts. of CuCl<sub>2</sub> and C<sub>6</sub>H<sub>5</sub>N and an excess of HCl; without excess HCl, only II is ptd., but it redissolves in excess HCl and, on evapn., gives III, which can be recrystd. from H<sub>2</sub>O. In alc., III decomp. to I, and in Me<sub>2</sub>CO to 1·2HCl, insol. in C<sub>6</sub>H<sub>6</sub>, CCl<sub>4</sub>, etc. III m. 194-5° (decompn.). In air, III loses H<sub>2</sub>O and HCl, becoming 3CuCl<sub>2</sub>·2C<sub>6</sub>H<sub>5</sub>N (IV), a light-green powder, which cannot be obtained directly from CuCl<sub>2</sub> and C<sub>6</sub>H<sub>5</sub>N. In H<sub>2</sub>O, IV decomp. to I. With HCl, it forms III. It is stable in air at room temp., decomp. above 100°, and m. 272-3° (decompn.). Blue CuCl<sub>2</sub>·5C<sub>6</sub>H<sub>5</sub>N was obtained with CuCl<sub>2</sub> and a large excess of C<sub>6</sub>H<sub>5</sub>N, within 10 days at a temp. not over 12-15°, faster at -10°. N. Solubility in the system ethyl alcohol-1,2-dichloroethane-water. V. V. Udovenko and L. G. Fatkulina (Sredneasiat. Gosudarst. Univ., Tashkent). Zhur. Fiz. Khim. 26, 892-7 (1952). Solv. of H<sub>2</sub>O in C<sub>2</sub>H<sub>5</sub>Cl was (calcd. between 10° (0.0357 wt. %) and 00° (0.518%). Solv. of C<sub>2</sub>H<sub>5</sub>Cl in H<sub>2</sub>O was, e.g., 0.877% at 20° and 1.380% at 72.5°. Over 50 ternary poly. were measured. E.g., EtOH 23.7%, H<sub>2</sub>O 76.24% dissolved 1.490% C<sub>2</sub>H<sub>5</sub>Cl at 25°; EtOH 32.3, H<sub>2</sub>O 47.7% dissolved 18.45% C<sub>2</sub>H<sub>5</sub>Cl at 34°; EtOH 31.5, C<sub>2</sub>H<sub>5</sub>Cl 68.5% dissolved 12.14% H<sub>2</sub>O at 83°; and EtOH 10.4, C<sub>2</sub>H<sub>5</sub>Cl 89.4% dissolved 1.07% H<sub>2</sub>O at 44°. Also d. and s. of many solns. at 30° and 40° and d. of solns. at 60° and 60° were detd. The compn. of conjugated layers is listed. Thus, at 30° the liquid H<sub>2</sub>O 92.7, EtOH 6.3, C<sub>2</sub>H<sub>5</sub>Cl 1.0% was in equil. with H<sub>2</sub>O 0.5, EtOH 1.0, C<sub>2</sub>H<sub>5</sub>Cl 98.5% and 51.5, 39.5, 9.0% in equil. with 3.0, 19.0, 84.0%. At 40°, 88.8, 9.0, 1.3% was in equil. with 7.0, 22.3, 70.7%. At 60° 80.8, and 30.0, 41.1, 10.0% with 7.0, 22.3, 70.7%. At 60° 80.8, 17.0, 2.2% was in equil. with 0.9, 4.2, 94.9%, and 41.7, 39.1, 19.2% with 7.2, 22.0, 70.8%. At 60° 90.1, 7.0, 2.0% was in equil. with 0.6, 1.8, 97.7%. The calcd. compn. of the crit. solns. was at 30° H<sub>2</sub>O 18.3, EtOH 34.3, C<sub>2</sub>H<sub>5</sub>Cl 47.4% at 40° 19.2, 32.9, 47.9%, and at 60° 19.6, 31.4, 49.0%. J. J. Bikerman.

"The Equilibrium of Liquid-Liquid in a Ternary System," V. V. Udoeneko and I. G. Fatkulina, Central Asian State U, Tashkent

"Zhur Fiz Khim" Vol 26, No 11, pp 1569-1572

The authors examined the eq of L. A. Rotinyan and showed that in the case of a paraboloidal curve of sepn in ternary systems, the nodes can be parallel to the side of the triangle when the liquid phases are in equil. On the basis of the above-mentioned eq, the authors concluded that the critical point of mutual solv in ternary systems can also be located at the vertex of the binodal curve of sepn.

✓Reaction of lupinine and diethylaminooethanol with copper chlorides. V. V. Udoenko and L. P. Aleksandrova (Central Asia State Univ., Tashkent). *Sovnkh. Sistem. Oshchesh. Khim.* 2, 1120-3 (1953).—Lupinine and dry  $CuCl_2$  in abs. EtOH form brown  $CuH_4NOH.CuCl_2$ , decomp. 125°, which slowly decomposes on exposure to air. If twice the proportion of lupinine is used, there is obtained a green alcoholate  $C_9H_{11}NO.Cu(I)$  (I), m. 215° (from  $C_6H_5CH_3Cl$ ), while the evapd. filtrate yields lupinine HCl salt, m. 211.5°. I also forms on mixing abs. EtOH soln. of lupinine with  $CuCl_2$  in contact with atm. O<sub>2</sub>. Addn. of abs. EtOH soln. of  $Et_2NCH_2CH_2OH$  to EtOH soln. of  $CuCl_2$  gave green  $Et_2NCH_2CH_2O.CuCl$ , m. 160° (from  $C_6H_5CH_3Cl$ ), while evapn. of the soln. gave the amine HCl salt. Thus the original adduct is transformed into the alcoholate under action of excess amino alc., which results in loss of HCl and formation of I analog and amine HCl salt. (G. M. K. Molapoff)

✓ Separation of mixture of alkaloids anabasine and lupinine.  
V. V. Uloverko, O. I. Grinova, and L. A. Vvedenskaya  
(Central Asian State Univ., Tashkent). *Sov. Selsk. Nauki*  
L'stiches. Khim. 2, 1123-6 (1951). — The sepn. is performed  
through the Cu salts (cf. following abstr.) as follows. The  
mixt. of known compn. of anabasine and lupinine is treated  
with a highly concd. soln. of  $\text{CuCl}_2$  and HCl or  $\text{Cu}(\text{NO}_3)_2$  and  
 $\text{HNO}_3$ , made up on the basis of theoretical calcn. to form  
either  $\text{CuCl}_2 \cdot 2\text{HCl}$  or  $\text{Cu}(\text{NO}_3)_2 \cdot 2\text{A} \cdot 4\text{HNO}_3$  (A = ana-  
basine), with cooling. The order of addn. is immaterial.  
Since the mixt. now contains a ppt. of Cu oxide, addn. acid  
is added to dissolve this (avoid excess of  $\text{HNO}_3$ ). Traces of  
kerosine from com. alkaloids are removed at this point by  
boiling. The mixt. then yields cryst. salt of anabasine,  
which treated with concd.  $\text{NaOH}$  gives the pure base, which  
is purified by distn. *in vacuo*. The evapd. filtrate from the  
salt is treated with concd.  $\text{NaOH}$  and extd. with  $\text{C}_6\text{H}_6$ .  
Evapn. of the ext. yields cryst. lupinine. The HCl salt  
gives somewhat better results. Pure anabasine bp 107-10°,  
 $n_D^{20}$  1.5120;  $\text{D}_4$  1.0469; lupinine m. 65°. C. M. K.

## Interaction of anabasine with mercuric and mercurous chlorides. V. V. UDOVENKO, M. A. Adurov and I. S.

UDOVENKO. Doklady Akad. Nauk. Uzbek. SSR 1953, No. 5, 38-41; Referat. Zhur. Khim. 1954, No. 27, 97.  $HgCl_2$  reacted with anabasine (I) in aq. soln. to form a white amorphous compd.  $HgCl_2 \cdot C_{19}H_{14}N_2$  (II), m. 211° (decompn.). The reaction proceeds with appreciable evolution of heat and unless cooled a colored compd. is obtained. II was obtained by adding dropwise an aq. soln. of I to an aq. soln.  $HgCl_2$  cooled in ice water. Upon heating to 110° II turned yellow. It is nonhygroscopic, dissolves poorly in water (slightly better in hot water), acetone, and  $CH_3OH$ , insol. in benzene and toluene. After boiling, aq. solns. of II have an alk. reaction. II dissolves in I, liberating metallic Hg; addn. of  $Me_2CO$  hastens this reaction. In water acidified with  $AcOH$  or strong mineral acids II dissolved forming a compd. of different compn. Specifically aq. HCl formed  $HgCl_2 \cdot C_{19}H_{14}N_2 \cdot 2HCl$ , acicular crystals.  $HgCl_2 \cdot (III)$  reacted with I according to:  $HgCl_2 + C_{19}H_{14}N_2 + HgCl_2 \cdot C_{19}H_{14}N_2$ . A comparative study was made of the reaction of I, pyridine (IV), and piperidine (V) with III. The reactions were carried out with an excess of base in the absence of moisture. Immediately following the mixing, after 10 min., and after 7 days, the extent of interaction of I with III was 7, 9, and 18.9%, resp. For IV and III it were 30, 75.65, and 81.27%, and for V and III it was 11 and 15.96%, resp. In the last case, no detn. was made after 7 days. Thus, in its action on dry III, I is closer to V than to IV. In the presence of water, the interaction of I or IV with III does not exceed 1%. M. H.

Reaction of anabasine with organic acids. V. V. Udrovenco and L. A. Vvedenskaya (Central Asia State Univ., Tashkent) *Zhur. Obrabotki Khim.* 23, 1031-4 (1973). Anabasine (I) and  $\text{HCO}_2\text{H}$  yield crystalline  $\text{I} \cdot \text{HCO}_2\text{H}$ , very hygroscopic and sol. in org. solvents. I and  $\text{AcOH}$  gave  $\text{I} \cdot \text{AcOH}$ , m. 88°.  $\text{PrCO}_2\text{H}$  similarly gave  $\text{I} \cdot \text{PrCO}_2\text{H}$ , very hygroscopic solid. I and  $\text{iso-BuCO}_2\text{H}$  gave  $\text{I} \cdot \text{iso-BuCO}_2\text{H}$ , very hygroscopic solid. With  $(\text{CO}_2\text{H})_2$  there are formed:  $2\text{I} \cdot \text{C}_2\text{O}_4\text{H}_2$ , m. 210°,  $\text{I} \cdot \text{C}_2\text{O}_4\text{H}_2$ , m. 190°, and  $1 \cdot 2\text{C}_2\text{O}_4\text{H}_2$ , m. m. 81°; all are very sol. in the usual solvents. Malonic acid gave  $2\text{I} \cdot \text{C}_4\text{O}_4\text{H}_4$ , m. 80°. Succinic acid gave very hygroscopic  $2\text{I} \cdot \text{C}_4\text{O}_4\text{H}_4$ . Tartaric acid gave solid  $2\text{I} \cdot \text{C}_4\text{H}_4\text{O}_4$ .

Citric acid gave solid  $3\text{I} \cdot \text{C}_6\text{H}_8\text{O}_7$ . With naphthalene-2-sulfonic acid there are formed:  $\text{I} \cdot \text{C}_10\text{H}_7\text{SO}_3\text{H}$ , m. 139° and  $1 \cdot 2\text{C}_10\text{H}_7\text{SO}_3\text{H}$ , m. 121°.

Heats of vaporization of three-component liquid mixtures.  
V. V. Udrovko and I. G. Fatkulina (Central Aerohydrodynamic Institute, Tashkent), Zhur. fiz. khim. 27, 1063-7 (1953);  
cf. C.A. 47, 6748i.

The heats of vaporization ( $L$ ) of ternary mixts. contg. 10-40 mole % 3OH (I) with varying proportions of benzene (II) and 1,2-dichloroethane (III) were calc'd. by means of the Clausius-Clapeyron equation from exptl. data published earlier (*loc. cit.*). Values of  $L$  so calc'd. agree within 1% or less on the av. with those calc'd. by means of the equation  $L = L_{1j} + L_{2j} + L_{3j}$ , where  $L_{ij}$  is the heat of vaporization of the  $j$ th component and  $y_j$  is its mole fraction in the gas phase. Three sets of values are tabulated. The equation  $L = (L_{1j}x_{1j} + L_{2j}x_{2j} + L_{3j}x_{3j})/(p_{1j}y_{1j} + p_{2j}y_{2j} + p_{3j}y_{3j})$ , where  $p_j$ ,  $y_j$ , and  $x_j$  are the vapor pressure in the pure state, the activity coeff. and the mole fraction of the  $j$ th component in the liquid phase, resp. was derived. Viscosity of some binary systems with nicotine. V. V. Lidovenko and S. V. Balak. *Trudy Sredaz. Gos. Akad.*, Ural. Khim. Nauki 5, No. 30, p. 161-163; *Referat. Zhar.*, Khim. 1954, No. 2218; cf. *C.A.*, 45, 933d, 46, 2601g. The viscosity and d. of mixts. of nicotine with  $\text{CHCl}_3$ ,  $\text{CH}_2\text{Br}_2$ , tetrachloroethane,  $\text{EtOH}$ , iso- $\text{BuOH}$ ,  $\text{AmOH}$ , and cyclohexyl alc. were studied at 25, 50, and 75° and of nicotine and  $\text{MeOH}$  at 25 and 50°. The nature of the relation between the viscosity values and molar compn. indicates interaction between nicotine and  $\text{CHCl}_3$ , ethyl ene bromide, tetrachloroethane, and  $\text{Me}$ ,  $\text{Et}$ , and iso- $\text{Bu}$  ales. The interaction of these substances with nicotine indicates their acidic nature in relation to nicotine as a base. The viscosity isotherm of nicotine mixt. with cyclohexyl alc. shows no reaction between the two. The acidic properties of the halogen derivs. increase with the no. of halogen atoms in the mol. and increases also upon the replacement of  $\text{Cl}$  by  $\text{Br}$ . In the case of ales., an increase in the length of the hydrocarbon chain attenuates their interaction with nicotine

✓ 1842. Conductometric titration of certain alkaloids.

V. V. Udoenko and L. A. Vvedenskaya. *Ukr. Khim. Zh.* 1964, 20 (6), 684-689. — By conductometric titration with naphthalene-2-sulphonic acid in acetone solution, the alkaloids present in the following mixtures were separately determined: anabasine - lupinine, anabasine - nicotine, anabasine - nicotine - lupinine, also anabasine - lupinine in the presence of aphylline and aphyllidine. The method depends on the effect of acetone in increasing the difference between the ionisation constants of the bases. It can be applied to the determination of alkaloids in technical products.

TITLE: Viscosity of Germanium Tetrachloride - Ethers Systems. (Vyazkost' Sistem Chetyrekhkhloristy Germaniy - Efiry).

PERIODICAL: "Zhurnal Neorganicheskoy Khimii" (Journal of Inorganic Chemistry) Vol. II, No. 2, pp. 434-438 (U.S.S.R.). 1956

ABSTRACT: A study of the complex-forming ability of germanium tetrachloride would be useful in enabling a comparison to be made of the properties of various addition products of IV group element tetrahalides; the rules governing the formation of these products could also be deduced. In connection with this studies have been made of the viscosities of binary systems of which one component was always germanium tetrachloride, the others being various organic compounds. All materials were carefully dried to avoid hydrolysis of the tetrachloride. Measurements were made of the viscosity and also the density of the following systems: germanium tetrachloride - acetoacetic ester, germanium tetrachloride - anisole at 20, 30 and 40°C; germanium tetrachloride - dioxane at 25 and 40°C, and germanium tetrachloride - diethyl ether and germanium - tetrachloride - dimethyl sulphide at 200°C. It was found that in contrast to titanium and tin tetrachlorides, germanium tetrachloride does not form addition products with the above type of compounds; this is explained as being connected with the increase in the

Esters.

Orig Pub : Zh. neorgan. khimii, 1957, 2, No 2, 434-438

Abstract : The viscosity and density of binary systems composed by germanium tetrachloride (I) with ethyl acetate (II), anisole (III), dioxane (IV), diethyl ether (V) and dimethylsulfide (VI) were measured. The systems I - II and I - III were studied at 20, 30 and 40°, the system I - IV was studied at 25 and 40°, and the systems I - V and I - VI were studied at 20°. All the operations of preparing the solutions and carrying out the measurements were done under airtight conditions. Viscosity was measured

in a closed viscosimeter for volatile liquids described earlier (Toropov A.P., Zh. prikl. khimii, 1939, 12, 1744). The viscosity isotherms of the studied systems are convex with reference to the composition axis, which indicates the absence of a chemical interaction between the components. The authors connect the absence of interaction with an increase of the screening of the central atom in I.

## TITLE:

Viscosity of Binary Systems with Chloral.4 (Vyazkost' binarnykh sistem s khloralem. IV.)

## PERIODICAL:

Zhurnal Obshchey Khimii, 1957, Vol. 27, No. 1, pp. 37-40 (U.S.S.R.)

## ABSTRACT:

Investigations were conducted to determine the viscosity and density of binary systems consisting of chloral with acetophenone (boiling point  $80.0^{\circ}$  at 12 mm); benzophenone (b. p.  $161.0^{\circ}$  at 11 mm); benzaldehyde (b. p.  $177.2^{\circ}$  at 731 mm) and salicyaldehyde (b. p.  $193.0^{\circ}$  at 727 mm). The viscosity/density measurements were carried out at temperatures of 25, 50 and  $75^{\circ}$  and the results obtained are given in tables (for each mixture separately). The isothermal viscosity/density curves are either slightly convex or rectilinear, depending upon the temperature. None of the systems investigated showed any definite reactions between the components which could lead to the formation of any specific chemical compound.

Four tables. There are 5 references, of which 4 are Slavic.

TITLE:

Viscosity of Binary Systems with Chloral. Part 5. (Vyazkost' binarnykh sistem s khloralem. V.)

PERIODICAL:

Zhurnal Obshchey Khimii, 1957, vol 27, No 2, pp. 322-325 (U.S.S.R.)

ABSTRACT:

In order to explain the nature of the reaction between chloral and ether, ethyl formate, chloral - ethyl acetate, chloral-ethyl ether, chloral - anisole and chloral - acetoacetic ester, chloral-ethyl acetate, chloral - 75°. Viscosity was found to be constant in the first four systems and in the fifth one it varies with time. A reaction between the components was established in all systems investigated but only the reaction of the chloral-acetoacetic ester system is clearly expressed and this is explained by the presence in the molecule of the latter of a hydroxyl group.

It was established that acetoacetic ester in the presence of pyridine reacts with chloral forming a compound which during distillation in vacuum

Card 1/2

Viscosity of Binary Systems with Chloral. Part 5 79-2-9/58  
decomposes into chloral and acetoacetic ester. Optical investigation  
of acetoacetic ester solutions in pyridine showed that the latter like  
alcohol, reacts with the pyridine by means of the hydroxyl group. Also  
the reaction between the chloral and the acetoacetic acid is due to this  
hydroxyl group of enol form.

Title : Interaction of Silicon Tetrachloride with Acetic and Benzoic Anhydrides.

Orig Pub: Zh. Obshch. Khimii, 1957, 27, No 4, 905-906.

**Abstract:** It was established that  $SiCl_4$  can interact directly with anhydrides of organic acids thereby forming mixed anhydrides of organic and orthosilicic acids. This reaction proceeds under less rigid conditions than the reactions of interaction of  $SiCl_4$  with corresponding acids. By means of the above reaction the tetraacetate and tetrabenoate of silicon were obtained in good yields.

TITLE:

The Viscosity of Binary Systems With a Substitution Reaction (Vyazkost' dvoynikh sistem s obmennym vzaimodeystviem)

PERIODICAL:

Zhurnal Obshchey Khimii, 1958, Vo. 28, Nr 3,  
pp. 814-818 (USSR)

ABSTRACT:

The viscosity diagrams of binary systems are to a great extent systematized at present and are often used for the explanation of the occurring processes. When systems with chemical reactions are considered the present classification (Ref. 1) provides diagram types for such systems in which chemical reactions take place with a decrease of the molecular number, e. g. in the system water-chloral, or for systems in which the molecular number does not change, e. g. in the system acetic anhydride-water. Such systems have been little investigated. Therefore N. A. Trifonov suggested such model systems as, among other, diethyl-water systems conducive to visualization of the type of the diagram of viscosity when only

Card 1/3

The Viscosity of Binary Systems With a Substitution Reaction

79-28 -3-54/61

one chemical compound without a decrease of the molecular number is formed. It must be noted that in the system acetic anhydride-water the number of molecules remains the same after the chemical reaction had taken place as two molecules of acetic acid are formed from the molecules of this anhydride and water. The reaction leading to the formation of a chemical compound is not the only possible for reactions where the molecular number remains unchanged. Not less frequent is the substitution reaction where the final products are two chemical compounds. Systems of this kind are of great interest for the theory of physical and chemical analysis; they have, however, not been investigated by any chemical scientist with respect to the viscosity method. Below, data on the viscosity of systems are mentioned in which one component is silicontetrachloride and the other one of the following compounds: methylal (dimethoxymethane), acetal (1,1-diethoxyethane) and acetic anhydride. According to the methods of viscosity and density the binary systems silicontetrachloride-methylal at 20 and 30°C, silicontetrachloride-acetal at 20, 30 and 40°C and silicontetrachloride-acetic acid anhydride in benzene

Card 2/3

The Viscosity of Binary Systems With a Substitution 79-23 5-54/6:  
Reaction

as indifferent medium at 20°C were investigated. The authors found that in the reaction of silicontetrachloride with methylal the final products are: dichlorodimethoxysilane and chlorodimethylether, and with acetal: dichloroethoxysilane and chlorodiethylether. This reaction represents a new method of the synthesis of dichlorodialkoxysilane which differs from the existing ones by its good yield and by the purity of the products. There are 1 figure, 3 tables and 5 references, 4 of which are Soviet.

TITLE: The Solubility in the System Formic Acid - 1,2-Dichloro Ethane - Water (Rastvorimost' v sisteme murav'inaya kislota - 1,2-dikhloretan - voda)

PERIODICAL: Zhurnal fizicheskoy khimii, 1958, Vol. 32, Nr 8, pp. 1889-1892 (USSR)

ABSTRACT: The mutual solubility in the above mentioned ternary system was investigated within the temperature range of from 20 to 70° according to the polythermal method by V. F. Alekseyev. The data of the mutual solubility of water and dichloro ethane were taken from other publications. In the determinations of the solubility eight polythermal lines were taken at different constant ratios between formic acid and dichloro ethane, and the results obtained were given in a table. There exists a greater laminated section in the system which decreases on an increase in temperature. For determining the intersections in the system the compositions of the layers of equilibrium were determined by a titration of the acid in both layers at 30, 45 and 60°C. The kinetic points of the mutual solubility on the curves of the separation of layers were determined according

Card 1/2

SOV/76-32-8-26/37

The Solubility in the System Formic Acid - 1,2-Dichloro Ethane - Water

to the method mentioned above. The coefficients of distribution were calculated. The difference observed between the system  $H_2O-C_2H_5OH-C_2H_4Cl_2$  and that investigated was explained by the greater coefficient of distribution of formic acid as compared to that of ethanol. There are 5 tables and 3 references, 2 of which are Soviet.

On the Interaction of Copper Chloride With Monoethanolamine  
(O vzaimodeystvii khlornoy medi s monoetanolaminom)

## PERIODICAL:

Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 2,  
pp 352-355 (USSR)

## ABSTRACT:

On the interaction of monoethanolamine with copper salts complex compounds of various compositions are formed. The following compounds are formed by copper chloride with ethanol amine combined with hydrochloric acid:  $[\text{CH}_2\text{OHCH}_2\text{NH}_3]\text{CuCl}_3$  and  $(\text{CH}_2\text{OHCH}_2\text{NH}_3)_2\cdot\text{CuCl}_4$ . On the interaction of a concentrated alcoholic solution of copper chloride with monoethanol amine the compounds  $\text{CH}_2\text{NH}_2\text{CH}_2\text{OCuCl}$  and  $(\text{CH}_2\text{OHCH}_2\text{NH}_3)\text{CuCl}_3$  are formed. In weak solutions of copper chloride in acetone the compound  $\text{Cu}(\text{CH}_2\text{OHCH}_2\text{NH}_2)_4\text{Cl}_2$  is formed. This compound crystallizes in well formed blue crystals whose melting point is  $103^\circ$ ; it is soluble in alcohol and water, and insoluble in acetone. On the interaction of copper chloride with  $\text{Cu}(\text{CH}_2\text{OHCH}_2\text{NH}_2)_4\text{Cl}_2$
